RETURN TO

LIBRARY OF MARINE BIOLOGICAL LABORATORY

WOODS HOLE, MASS.

LOANED BY AMERICAN MUSEUM OF NATURAL HISTORY

A

CATALOGUE

OF THE

SHELLS,

ARRANGED ACCORDING TO THE

LAMARCKIAN SYSTEM;

TOGETHER WITH

Descriptions of New or Rare Species,

CONTAINED IN THE COLLECTION

OF

JOHN C. JAY, M. D.

MEMBER OF THE LYCEUM OF NATURAL HISTORY, NEW-YORK; CORRESPONDING MEMBER OF THE ACADEMY OF NATURAL SCIENCES, PHILADELPHIA; OF THE UNITED STATES NAVAL LYCEUM, BROOKLYN; OF THE BOSTON NATURAL HISTORY SOCIETY, &c.

ILLUSTRATED BY SEVERAL PLATES.

THIRD EDITION.

NEW-YORK:
PUBLISHED BY WILEY & PUTNAM, No. 161 BROADWAY;
AND 67 PATERNOSTER-ROW,
LONDON.

1839.

D. Fanshaw, Printer, 150 Nassau-street, New-York.

INTRODUCTORY

OBSERVATIONS.

In submitting the third edition of my Catalogue to the Public, in its present form, it is proper to remark, that, owing to its not being in my power to consult some of the works referred to, and, in consequence, being obliged occasionally to copy a reference, there may be errors to be met with; but, so far as it has been in my power, the *References* will be found correct.

The Arrangement pursued is that of Lamarck, with the new Genera of later writers interspersed, in their proper places. Great care has been taken to have the *authorities* and *localities* correct; and wherever there was any doubt, a note of interrogation has been placed, and the space left blank; all which spaces, I trust, some of my friends will enable me to fill.

It is entirely owing to the generosity of my numerous correspondents, both abroad and at home, that it is in my power to add many species to the present edition; and I trust that they will consider my returns in as favorable a view.

The two former editions of this Catalogue having answered the purpose for which they were published, viz., that of presenting to my *correspondents and others*, in a convenient form, what shells I had, and what I could furnish in return, I submit the present one *to the Public*, in the hope, that besides the above object, it may prove of some use. The names

of 305 Genera appear, arranged in their proper order. Upwards of 500 American species will be found distributed among the different Genera, with references to American works, where they are figured or described. Indexes are annexed, containing the full titles of all the works referred to, and the names of the authors of species, which are generally abbreviated.

With regard to the shells figured in the Plates, my object is to obtain information respecting them, whether they are new or not, and I will therefore be happy to receive any information respecting them; only observing, that, in the event of any of them proving new, a further description of them will appear in the Annals of the Lyceum of Natural History of this City. I have been disappointed in the execution and coloring of the Plates, particularly in the figures of Conus Rhododendron, Couthouy, and Dolium Melanostomum, Nobis, which fall far short of exhibiting their beauty and brilliancy.

Plate I. of the last edition, containing well-known shells, as it would appear, has not been inserted; but for the information of those of my friends who may not be aware of the fact, I would state that Figure 1 is Bulimus pentagruelina, Moricand. Figure 2 is Pupa elatior, Spix. Figure 3 is Bulimus melanostomus, Swainson. Figure 4 is the young shell of Bulimus bilabiatus, Sowerby, published in the Zoological Journal, vol. v. p. 49, and afterwards, Bulimus maximilianus, by Moricand.

In the Malacological and Conchological Magazine, Part 1st, for a copy of which I am indebted to the Author, Mr. G. B. Sowerby, that gentleman remarks, that *Aplysia* is more proper than *Laplysia;* and also desires to know the author of the Genus *Dythalmia.* My Catalogue was too far advanced to make the desired alteration, or to insert the above authority. I have since learned, that M. Mühlfield is the author of *Dythalmia Danubii*, and am disposed to think it a different species from the *Mytilus polymorphus, Gmel.*

Collectors are not probably aware that the Numbers, in the first column, are, and always will be constant; so that by placing the same Numbers on their specimens, and making a slight mark opposite the corresponding number in the Catalogue, they will have a Catalogue of their own collection, with very little trouble; and, by having it interleaved, can insert any others, in their proper places.

With respect to exchanges, I repeat, that it will give me pleasure to exchange duplicate specimens, and will receive *live and perfect* shells, whether they are enumerated in this Catalogue or not; and, as far as I am able, supply whatever may be desired in return.

JOHN C. JAY, 22 Bond-street.

New-York, April, 1839.

CATALOGUE

OF THE

SHELLS

IN THE COLLECTION OF

JOHN CLARKSON JAY.

Partsch.
Payr.—Payraudeau.
Pennt.—Pennant.
Petit.
Pfeif.—Pfeiffer.
Poir.—Poiret.
Poli.
Pult.—Pultney.

Quoy.
Qu. et G.—Quoy et Gaimard.

Rang.
Rav.—Ravenel.
Retz.—Retzius.
Rossm.—Rossmaesler.

Say.
Schmidt.
Soland.—Solander.
Sowb.—Sowerby.
Spix.
Stud.—Studer.
Swains.—Swainson.

Terver.
Totten.
Turt.—Turton.

Valen.—Valenciennes.

Wagn.—Wagner.
Walch.
Waltz.
Ward.
Webb.
Willa.
Williams.—Williamson.
Wood.

Zeigl.—Zeigler.

EXPLANATION

OF THE

PLATES.

PLATE I.

Figure 1. Bulimus cinctus, Nobis.

Habitat, Calcutta.

Remarks.—In the event of this shell not having been previously described, I propose the above name for it, from the White Band with which the body whorl is girt. For the possession of this rare Bulimus I am indebted to Burn W. Budd, M. D. of this City.

Figure 2, 3. Turbo Rotelliformis, Nobis.

Habitat, South Seas.

Remarks.—This shell was brought into Boston during the last year, and appears to be undescribed; on the upper surface it has every appearance of a large Rotella, but underneath the large and deep Umbilicus shows that it does not belong to that Genus. Should it prove to be new, a description of it will appear in the Annals of the Lyceum of Natural History of this City.

Figure 4. AMPULLARIA Brownii, Nobis.

HABITAT, River Amazon.

Remarks.—This ponderous Ampullaria was procured from Capt. Brown, of Beverly, Massachusetts, who brought it from the above mentioned locality. It bears some resemblance to the Ampullaria crassa, Swains. figured in Spix. tab. V. f. 1. It may, however, be only a variety.

Figure 5. AMPULLARIA Storeria, Nobis.

HABITAT, River Amazon.

Remarks.—This is also one of the rarities brought home by Capt. Brown; and it is at his suggestion that I have named it after a very able and zealous Naturalist, D. Humphreys Storer, M. D. of Boston.

Figure 6, 7. HELIX Planorbis, Nobis.

HABITAT, Island of Togobo, Gulf of Guyaquil.

Remarks.—This beautiful shell was found by Capt. Sloat, U. S. N. It is owing to the generosity of his Son, in whose cabinet it was, that I am enabled to add this unique shell to my collection. It was the only one obtained, although some time was spent in searching for another. The marking on the upper surface is very similar to that of the Helix pellis-serpentis.

Figure 8, 9. PALUDINA scalaris, Nobis.

HABITAT, Everglades of Florida.

Remarks.—This shell is white, semi-transparent, and very fragile; the sutures of the whorls are very angular, and of the same character with the Ampullaria scalaris, D'Orbigny. It was presented to me by Count Castelneau, whose researches in this country will, without doubt, add much interesting matter to our knowledge of Natural History.

Figure 10, 11. LYMNÆA gracilis, Nobis.

HABITAT, Essex Co. New-York.

Remarks.—I am indebted to Professor Benedict, of Burlington, Vermont, for two specimens of this very slender and fragile Lymnæa.

Figure 12, 13. NUCULA Eightsii, Couthouy.

Annals Lyceum Natural History.

HABITAT, New South Shetland.

Remarks.—A description of this new species of Nucula was read before the Lyceum during the last year, by Joseph P. Couthouy, Corresponding Member. Mr. C. presumes this to be a new species, from its remote locality, and the fact that it is neither alluded to by M. Des Hayes in his new edition of Lamarck, nor figured by Sowerby in his "Illustrations of the Genus Nucula," which embody all the new ones carried to England by Mr. Cumings, from the South Atlantic and Pacific Oceans. A few specimens only of this shell were picked up on the shores of New South Shetland, by Dr. James G. Eights, of Albany, N. Y.

Figure 14, 15. VENERUPIS Peruviana, Nobis.

HABITAT, Coasts of Peru.

Figure 16. FISSURELLA nigrita? Sowerby.

Zoological Proceedings, p. 127, 1834.

HABITAT, Tiger Bay, West Coast of Africa.

Remarks.—Mons. Largilliert, of Rouen, France, sent me this shell, with the following description of it made by a friend of his, who found a few specimens only at the above locality. "It was found in an animal having a black skin, and a reddish-colored belly—of a very tough substance, and nearly as thick as the hand. The *shell* is smooth on the back, and is entirely enveloped by the skin, with the exception of a small hole. It is found in the crevices of rocks washed by the sea."——

It is a pure white within; and the margin, which is entire, has the appearance of having had a narrow strip of the external coating ground off, showing a white margin around the base of the shell, externally.

Figure 17, 18. TRICHOTROPIS costellatus, Couthouy.

Boston Journal Natural History, vol. 2, pl. 3, f. 2.

HABITAT, deep waters of Massachusett's Bay.

Figure 19, 20. NUCULA Portlandica, Hitchcock.

Boston Journal Natural History, vol. 1, p. 327.

Remarks.—Fossil. From the tertiary formation near Portland, Maine. I am indebted to Mrs. S. Dunlap, of Salem, for specimens of this fossil.

Figure 21. HELIX denticulata, Nobis.

HABITAT, unknown.

Remarks.—This Helix has been in my collection for several years, and I cannot find that it has been described; nor have I ever seen a duplicate.

PLATE II.

Figure 5. CERITHIUM marmoratum, Quoy et Gaimard.

"Cerithium, testa turrita, tuberculosa, transversim striata, apice plicata, albido lutescente, fusco vel subrubro marmorata; apertura ovali, albida; canali recurvo."

Voyage de l'Astrolabe, Zoologie, tome 3, par. 1, page 109, pl. 54, fig. 4.

HABITAT, New Holland. ?

Remarks.—When the second edition of this catalogue appeared, I was not aware that this shell had been previously figured. Having however lately received a copy of the above splendid work, I immediately discovered Cerithium magnum, Nobis, to be the Cerithium marmoratum of Messrs. Quoy and Gaimard, whose description I have taken the liberty to copy. Of the two specimens in my Cabinet, one is exactly five inches in length.

Figure 6, 6. RANELLA pulchra, Gray.

Sowb. Conch. Illust. Ranella, fig. 19.

Biplex Perca, Perry's Conch. pl. iv. f. 5.

HABITAT, East Indies. ?

PLATE III.

Figure 7. AMPULLARIA scalaris, D'Orbigny.

Guérin's Magasin de Zoologie.
Ampullaria angulata, Nobis,

HABITAT, Mexico.

Figure 8. AMPULLARIA ochracea, Nobis.

A. testa ventricoso-globosa, tenui, lævi, ochracea; anfractibus convexis et ad suturas albo-cærulescentibus.

HABITAT, Spanish Maine.

Remarks.—Mr. G. B. Sowerby, in the 1st part of his Malacological and Conchological Magazine says, that this shell is only a variety of Ampullaria fasciata, Lamarck. I received eight specimens of this beautiful shell, all precisely alike, except that some were larger than others. The person from whom I obtained them told me that they came from the Spanish Maine; and I am still of the opinion that it is a distinct species.

Figure 9, 9. HELIX speciosa, Nobis.

H. testa subglobosa, imperforata, spadicea; anfractibus fasciis albis transversis.

HABITAT, unknown.

Remarks.—I have received another specimen of this pretty Helix, which was brought by a sailor from the Isle of France.

PLATE IV.

Figure 10, 10. NATICA fluctuata, Sowerby.

"N. testa subglobosa, pallida, lineis albis longitudinalibus flexuosis angulatim picta; spira brevissima, acuta; apertura magna, superne acuta, infra effusa, rotundata; umbilico angusto, tecto; callo columellari expanso, infra albo, crasso, supernè castaneo, tenuiore."

OBS. "Besides the longitudinal white zigzag lines upon a fawn-colored ground, there are four transverse bands, very little darker than the ground color itself. The dark chestnut edging to the expanded columella callus is a principal character of this shell."

Sowb. Tankerville Catalogue, Appendix, p. xii.
Natica imperforata, Nobis.

HABITAT, unknown.

Remarks. I take this opportunity to return my thanks to Mr. Sowerby for a beautiful copy of the above work; and also for pointing out his prior claim to the above shell. Having however figured it, I add the above description copied from the Appendix to the Tankerville Catalogue.

Figure 11, 11, 11. NERITINA granosa, Sowerby.

"N. Testa subrotunda, compressiuscula, subalata, alba, epidermide nigra induta, extus granosa, granis, per series ordinatis; labii externi margine crenulato; subtus planulata, labio columellari, lato, aurantiaco, margine interno sinuato, edentulo."

Sowerby, Tank. Cat. Appendix, page xi.
Sowb. Conch. Illust. Neritina, fig. 6.
Neritina papillosa, Nobis.

HABITAT, Sandwich Islands.

Remarks. I am indebted to Mrs. Say for several specimens of this curious and beautiful Neritina. They were brought from the Sandwich Islands by one of our Missionaries.

PLATE V.

Figure 1, 2. UNIO spinosus, Lea.

"Testa spinosâ, subtriangulari, inflata, inæquilaterali, posticè acuto-angulata; valvulis subcrassis; clivo umboniali carinato; natibus vix prominentibus; epidermide atro fuscâ, glabrâ; dentibus cardinalibus deorsum inclinantibus; lateralibus subgrandibus subcurvisque; margaritâ purpureâ."

Trans. Amer. Phil. Soc. vol. vi. p. 57, pl. xvi.

HABITAT, Altamaha River, Hopeton, near Darien, Georgia; also Liberty County, Georgia.

"Shell spinous, subtriangular, inflated, inequilateral, acutely angular behind; arcuate on the dorsal margin; substance of the shell rather thick, thinner behind; spines erect, opposed in each valve, placed in a row before the umbonial slope, and nearly parallel thereto; umbonial slope carinate; beaks scarcely prominent; ligament short and thick; epidermis dark brown, shining, finely wrinkled; cardinal teeth inclining downwards, single in the right and double in the left valve; enlarged and truncate at the anterior end; lateral teeth rather large, thickened and curved in the inferior portion; anterior cicatrices distinct; posterior cicatrices confluent; dorsal cicatrices placed in the inferior part of the cardinal teeth; cavity of shell deep; cavity of the beaks angular; nacre purple."

Mr. Lea also observes, in his interesting details of this shell, that "the teeth differ in some of their characters from any Unio with which I am acquainted. The highest part of the dorsal curve is equi-distant from the extreme ends of the two teeth. The cardinal teeth are remarkable for their form and position, being very much enlarged at the anterior end, and pointing to the anterior margin. The lateral teeth are lamellar, and unusually enlarged on the inferior portion, thus forming an inverted curve, the inferior portion of the double lamellar tooth being very much larger than the superior one. The nacre of the shell is purple, approaching a rose color, and is very beautiful."

The specimen in my Cabinet is a very perfect young shell, with only two perfect spines, one on each valve, and exactly opposite. These spines are hollow, and on the interior of each valve, and immediately underneath the spines, there is, in my specimen, a covered canal running towards the anterior margin, and into which a bristle may be inserted for half an inch. Whether this canal communicates with the external spines I cannot say; but it appears to me to be very probable. I am indebted to Major Leconte, of this city, for the beautiful specimen in my Cabinet. The figure is a copy of Mr. Lea's plate.

PLATE VI.

Figure 1. Bulimus ustulatus, Nobis.

Habitat, unknown.

Remarks. I procured this shell from a dealer in this City, and thus far have not been able to find any description that would apply to it. It is two and five-eighths of an inch in length, and about one broad. It has seven convex whorls, of which the last, or body whorl, appears contracted. The margin is reflected, has the appearance of a tooth on the centre of it, and is of a dirty bluish color. The aperture is contracted, and somewhat ear-shaped. The umbilicus is small, and formed by the reflection of the margin. The stripes are longitudinal and diagonal, and are remarkable for having a burnt or scorched appearance. The interior is a bluish white.

Figure 2. Bulimus Aurora, Nobis.

Habitat, unknown.

Remarks. This beautiful specimen has nine slightly convex whorls, is extremely light; semi-transparent; surface smooth and glistening, and the color is uniform throughout. It is slightly umbilicated, and is two and three-eighths of an inch in length. The apex is obtuse, and the sutures compressed and corrugated.

Figure 3. Achatina bicolor, Nobis.

Habitat, unknown.

Remarks.—This shell has six convex whorls, the sutures of which are marked by a broad, yellow-colored band. The lower parts of the whorls are of a dark reddish brown. The columella is very much arched, and the truncation very abrupt; lip acute; aperture white. I have three specimens; but this one, although the smallest, is the most perfect.

Figure 4. Bulimus virgatus, Nobis.

Habitat, unknown.

Remarks.—Shell polished, striped brown and white; margin reflected; apex rather obtuse; whorls five, slightly convex; columella a little concave; interior white.

Figure 5. Bulimus porraceus, Nobis.

Habitat, unknown.

Remarks.—This shell closely resembles the last, and may be only a variety. It is covered with a greenish yellow-colored epidermis. The margin is much expanded, and together with the interior is a beautiful glossy white; a small, dark-colored band commences at the umbilicus, crosses diagonally the columella, and disappears internally. It is much more umbilicated than the last, and is a heavier shell.

Figure 6, 7. Pandora striata, Quoy et Gaimard.

"Pandora, testa orbiculato-trigona, securiformi, alba, intus margaritacea; valva dextra plana, longitudinaliter striata."

Voyage de l'Astrolabe, Mollus. pl. 83, f. 10.

Habitat, New Zealand.

Remarks.—My specimen measures one inch and a half by one and a quarter, and is beautifully marked with crowded concentric plaits.

PLATE VII.

Figure 1. Bulimus tristis, Nobis.

Habitat, Zanzibar.

Remarks.—This shell is entirely new in our collections, and was received by Mrs. S. Dunlap, of Salem, Mass. who very kindly sent me the specimen which I have figured. The color is the same both externally and internally; the lip is acute; is slightly umbilicated, and has numerous longitudinal striæ.

Figure 2, 3. Conus rhododendron, Couthuoy.

"C. testa cylindracea turbinata, rosea, alba et fusca nubilata, punctis cinnamomeis superne inferneque notata, striis transversis sulciformibus numerosis, spira obtusa, columella superne sulcata, fauce alba."

Annals of the Lyceum Nat. Hist. Mass.

Habitat, Seas of Australasia.

"Shell cylindrically turbinate, of a blush rose color, longitudinally clouded with white and pink, surrounded by three bands, composed of irregularly grouped triangular pinkish colored dots; the first near the spire, the two lowest near the base, the interval being without spots: circled by about 30 impressed transverse striæ, which, near the base, deepen and widen into distinct sulcations; are inconspicuous near the middle, and become more prominent again near the spire. The spaces between these striæ are flattened in such a manner as to give the shell the appearance of being ribbed or hooped; thickly set, minute longitudinal striations cover the whole surface, but are most apparent in the transverse sulci—spine obtuse—its whorls concave, with three or four revolving striæ on each; aperture dilated at the base, with a strong oblique sulcus at the superior portion of the columella, and a prominent ridge near its lower extremity—lip internally of a rich cream color."

Remarks.—This very beautiful shell, which in the richness and delicacy of its coloration is equalled by few of the Genus, was presented to me by Augustus A. Adee, Surgeon U. S. N. It measures exactly two inches in length.

Figure 4, 5. Cyclostoma Cumingii, ? Sowerby.

Zool. Proceed. 1832. 2d Part, p. 32.

Habitat, Island of Tumaco, South America.

Remarks. I have two fine specimens of this large and rare Cyclostoma. The apex of the spine is visible in the Umbilicus. The largest one measures $2\frac{3}{8}$ of an inch in breadth, and $1\frac{1}{4}$ inch in length.

Figure 6. Bulimus dubiosus, Nobis.

Habitat, Brazil. ?

Remarks.—Shell turrited—mouth ear-shaped—columella with a white ridge, caused by the reflection of the internal lip, which covers, or rather forms an umbilicus—lip acute, aperture narrow, contracted, and produced backwards at its base, forming something like a canal. It has nine whorls slightly convex, and compressed at the sutures. It is striped longitudinally and diagonally, with irregular ferrugineous lines—size $1\frac{5}{8}$ inch in length, and $\frac{3}{8}$ broad. For this curious and interesting species I am indebted to G. W. Pratt, Esq. of Boston, Mass.

Figure 7, 8. Cyclostoma multicarinata, Nobis.

Habitat, unknown.

Remarks.—The last whorl of this shell has ten elevated horizontal ribs, or ridges, equi-distant from each other, and crossed longitudinally by numerous fine striæ—margin is reflected, and partly covers the umbilicus—lip white, shell reddish; with the exception of the fimbriated edge to the margin, it resembles Cyclostoma pulchrum, Sowerby's Genera of Shells, figure 2.

Figure 9, 10.—Cyclostoma maculosa, Nobis.

Habitat, unknown.

Remarks.—This Cyclostoma is remarkable for the angularity of the base of the body whorl, and somewhat resembles the base of a Trochus. The umbilicus is almost closed. The shell has a polished appearance, and is beautifully mottled with reddish brown blotches.

Figure 11. Melania læta, Nobis.

Habitat, Rivers in Alabama.

Remarks.—I cannot find that this Melania has been described by Mr. Conrad among those which he collected in the same state, and have therefore ventured to give it as a new species. The apex of the spine is eroded, which gives it a blunt termination.

Figure 12, 13. Cyclostoma multilineata, Nobis.

Habitat, unknown.

Remarks.—A very pretty shell, with five reddish lines surrounding the body whorl. The umbilicus is closed; the aperture is round, but the margin is indented on the external and superior part.

PLATE VIII.—IX.

Dolium melanostomum, Nobis.

Habitat, Friendly Islands.

Shell very large, ovate-globose, pretty light, very ventricose, ridged transversely with numerous convex ribs, alternated by other ribs, about two-thirds smaller, sunken between the larger ribs. The furrows which separate them are also sunken, and very distinct. Suture channeled; spire somewhat elevated, formed of five rounded convex whorls; the lower one forms of itself almost the whole of the shell. The aperture very large, of a bright coffee color within, and exhibits elevated transverse ribs corresponding to the external depressions. The right lip is a shining black, or nearly so, terminated by a festooned and denticulated border. The columella is entirely covered with a shining coffee-colored enamel, through which appear the transverse ribs; it spreads off from the columella towards the base, and forms a large umbilicus. The base of the columella and the five first ribs, which are closer together than the others, are of a dark reddish brown. The whole surface of the shell is of a pale brown color, with a few white spots on the face of the shell, and also on the second whorl of the spire. The right lip is colored dark brown, externally, for about three-fourths of an inch, forming the black margin in plate IX. The whole surface is also marked by numerous longitudinal striæ. It measures seven inches and three quarters in its transverse diameter, and nine inches in length.

Remarks.—This splendid shell was sent me about two years since from Nantucket. It was brought in there by a whaler, and was obtained at the above locality by the natives, who were diving for shells. It was the only one found, and has excited the admiration of every beholder by its beauty, size, and singularity of construction. It not answering to any description in Mons. Kiener's "Iconographie des Coquilles Vivantes," a work now in course of publication, and in which a monograph of the genus Dolium has appeared, I have no doubt that it is a new species, and one which surpasses all the others in splendor.

The peculiar arrangement of the transverse ribs on the surface point out at first sight its claim to a new species; to which may be added the magnificent enamelled appearance of the aperture. The two figures are the result of two different attempts to get an exact representation of this shell, but falls short in some little particulars; and for the coloring, I have found it utterly impossible to get justice done it. The figures, therefore, will only give a tolerably correct idea of the general appearance of the shell, but none of its beauties.

PLATE X.

Figure 1, 2. VOLUTA armata ?, Lamarck, variety.

HABITAT, unknown.

Remarks.—This rare shell has been in my collection for several years, and I have always been under the impression that it was a distinct species. Having, however, lately received the Livraisons of Mons. "Kiener's Iconographie," which contain figures of the Volutes, and upon examination of the figures of the Voluta armata, Lam., and its varieties, I am inclined to think this may be one of them. Not having received the text, I am only able to judge from the figures. My specimen has three large plaits on the Columella, with an additional small one above the others. It is a very delicate, light shell, although from its size one would suppose it to be heavier than it is. Length 8 inches, breadth 4 inches.
